Team 801 Girl Power

According to an article on FIRST's website by Shelley Henderson, there is a long list of initiatives to grow students' interest and proficiency in science, engineering, technology and math (STEM) fields, for all kids. But in terms of recruitment, confidence building, and the availability of relevant role models, there is still a gap when it comes to girls.

It is important to Team 801 robotics to help encourage and facilitate confidence in girls to participate in STEM programs. Whether they build a robot, program a computer, or even work on a business team affiliated with STEM, there is always need for them along side the boys. When we give any student the opportunity to demonstrate their value and make contributions we help them to know their worth and achieve their goals.
